

LIS-3353

From here, forward...

Hardware

- Topping out?

Moore's Law?

What CAN'T we do?

What CAN'T we conceive of?

Software

Diversity of Development

- Licenses
- Purposes
- Compensation/Deliverables/Fun?

(what is the marginal cost of software?)

A little more economics

Economies of Scale

Capitalism (the system) v. Capitalism (the culture)

“Incentives?” lol

Convenience (and magic)

- “Attach a device to your child that tracks everywhere they go and records nearly everything they do, and send that to a bunch of other companies – such that you have limited or no access to that data.”

We Are All Here Now (from underground to mainstream)

Government?

Schools?

Tech Companies?

Non-Tech Companies?

Everybody in between and otherwise?

So many good things...

We can talk to everybody.

We can record everything.

We can make anything.

True Efficiency

If we can't make X illegal...

...perhaps we can make it obsolete.

The Dual Nature of (some) Software/Startups

It has to

- Do the thing it says it does

AND

- Return money to the people making it.

(unless it's FOSS or non-profit?)

One idea: Freedombox

Freedombox

Take the decentralizable things and make them p2p and/or “federated”

Make your data yours; even physically.

Put it in your HOUSE.

On the purpose of college...

On the purpose of college...

(really, you should just google David Foster Wallace's Kenyon Commencement Speech)

(while you're there, read/watch Eben Moglen talk too)
